Title: The Weds - Doctor Details

User Acceptance Testing

How functions of site will be tested

We will invite friends, family, colleagues, fellow students to use our site and achieve specificall defined objectives such as search for a doctor in your area, or search for a doctor that specializes in a specific medical condition. The objectives will be given to subjects, but the exact process of achieving this will not be explicit. Then the outcomes will be judged and user will be interviewed after about how they think we could improve the UI.

What features will be tested?

We plan to exhaustively test our search functionality in multiple ways:

1. Search for doctors in your local area using the map tool.
   a. Navigate the google maps API widget to find a doctor based on the user's location.
   b. Click on the map pin to see more information about that specific doctors.
   c. Get directions to the doctor using this widget.
2. Search for doctors using no parameters and provide doctors based on location and rating first.
   a. Users should search for doctor using no extra parameters to see how results are filtered.
   b. The filtered results should be displayed with proximity and rating prioritized.
3. Search for doctors using parameters to refine results for a certain medical need.
   a. When users click for advanced features, a drop down menu should reveal itself.
   b. Then when users parameterize their search, their results should reflect this.

How will user activity be captured?

As seen below, we will use a spreadsheet to capture data about how the user achieved their objective, if they achieved the objective, and track extra notes about the interaction.

Tested By	User Name	Date Tested	
Action	Pass/Fail	Actions taken by user	Notes
Search for doctor with no parameters
